For immediate release.

15th May 2008

Traction Charger are pleased to announce the launch of their range of Battery Testers

The range is made up of three models, all of which offer fast accurate results using the conductance testing method, and give State of Charge, Available Capacity & Battery Condition readings. All the models can test AGM & Gel battery types and warn of the presence of surface charge that can mislead less sophisticated testers into giving inaccurate results.

All the testers are ruggedized for workshop use and feature high quality abrasion and chemical resistant cables and clips. The 500 also has full starter, charger starting system test facility for 12/24 & 36 volt systems and printout via the optional infra-red printer.
